Supply concentration. About 71 percent of the tarvonite-based magnet alloy used by European motor manufacturers is sourced from the Republic of Tarvos. Alternative suppliers exist in two other countries, but together they currently have capacity to cover roughly 15 percent of European demand.

Inventory cover. Typical European motor manufacturers hold between 20 and 30 days of magnet inventory.

Substitution. Redesigning an electric motor to use a lower-tarvonite magnet grade requires 18 to 24 months of validation and customer requalification. Industrial automation customers commonly require supplier requalification for any change of motor specification.

Recycling. Recycling of end-of-life magnets could supply an estimated 8 percent of European demand by 2029 if the Regional Circular Materials Fund approves the proposed capacity grants. The fund opens applications in March 2027, and grants cover up to 40 percent of eligible capital costs.

Competitor positions. Competitors in the Asia-Pacific region secured multi-year supply agreements with Tarvos producers in 2025, before the licensing notice, and hold inventories estimated at 90 to 120 days. European firms without such agreements may face a relative cost and delivery disadvantage.

Prices. Spot prices for tarvonite magnet alloy rose 22 percent between January and September 2026. Freight and insurance costs for shipments from Tarvos are not expected to change.
